INSTRUCTION MANUAL No 2E
DERWENT CPI REGISTRY COMPOUNDS

CONTENTS

1.Introduction	I.M.2E-p.1 to p.2
2.List for CPI sections B to M	I.M.3A-p.11.3 to 11.22
3.List for CPI section A (Plasdoc)	I.M.4A-p.109 to 129
4.List in number order	I.M.2E-p1.1 to 1.18

DERWENT REGISTRY COMPOUNDS

INTRODUCTION

This manual contains two lists in alphabetical order by name of common compounds which can be searched in CPI by a Derwent Registry Number. The first list containing about 2,100 compounds has been used for CPI Sections B,C and E from Week 8127 (D27) and from 1984 for CPI Sections D and F to M. The second list containing about 750 compounds is applicable to CPI Section A (Plasdoc). There are about 300 compounds common to both lists and for these the searchable 4 digit registry numbers is the same in both cases. As far as possible, commoner synonyms have been included for ease of reference. In addition there is a listing in compound number order.

GENERAL APPLICATION

RNs are applied to all compounds and non-metallic elements (which are covered by list), specifically mentioned in the claims or examples, with the exception of the following:

- (i) ingredients in compositions which are unimportant to the invention (e.g. specific solvents where any solvent may be used);
- (ii) auxiliaries (solvents, HCl scavengers, etc.) in reactions only in Sections B, C and E, which are unimportant to the invention (a full definition of auxiliaries is given in I.M. 3A).

SEARCHING

Each RN indexed is assigned one of three roles as follows, separated from it by a hyphen:

- P - compounds produced (by reaction, purification, extraction, etc.);
- S - starting material, reagents (auxiliaries only in Sections B, C and E);
- U - use of a compound (excluding S), ingredient in composition, compound detected, analysed, tested or removed.

Thus production of sodium chloride is searched online as 1706-P/RN, and all references to sodium chloride searched as 1706/RN.

SECTIONS B TO M APPLICATION

A generic RN is usually only included in the Section B to M registry list where the compounds covered by the RN have the same fragmentation codes (although they will not be coded by the chemical code if the patent is classified in D or F to M and not in B,C or E), or for an acidic (or basic) compound and its salts. This applies to the following groups of compounds, except where specific forms are provided for (and cross-referenced);

- (a) stereoisomers, e.g. 1210 (ALANINE) covers D- L- and DL-alanine
- (b) different physical forms, e.g. 1694 (SI-DIOXIDE) covers silica, quartz, sand etc.
- (c) compounds and their hydrates, e.g.

1767 (CA-SULFATE) covers CaSO_4 , $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$, gypsum etc., and 0387 (CHLORAL) also covers chloral hydrate

- (d) organic bases, hydrazine or hydroxylamine and their acid addition salts, e.g. 0048 (EPINEPHRINE) covers the base and its salts
- (e) onium salts, e.g. 1633 (PARAQUAT) covers the dichloride, dibromide etc.
- (f) acidic organic compounds and their metal (or ammonium) salts, e.g. 0222 (BENZYL-PENICILLIN) covers the free acid, Na and K salts etc.
- (g) variable oxidation state metal salts, e.g. 1935 (FE-SULFIDE) covers ferrous sulfide, iron disulfide, iron sulfide, iron pyrites etc.
- (h) compounds and their isotopic or radioactive analogues, e.g. 1781 (CHLORINE) is used for elemental chlorine, chlorine-35, chlorine-36 etc.
- (i) a few other groups of compounds whose members all have the same fragmentation codes, e.g. 2046 (HEPTENE) covers n-heptene (gen.), 1-n-heptene, 2-n-heptene, 3-n-heptene and trans-2-heptene etc.

One exception is that a few very commonly occurring mixtures of compounds (e.g. nitrogen oxide mixture) are assigned generic RNs; these RNs are applied only to the mixtures and never to single compounds. For acid addition salts or organic bases and for onium salts the anion is not normally assigned an RN (or fragmentation codes) unless important to the invention.

RNs for polymeric compounds are only applied to references in CPI Sections B and C. Free metals are not included in the registry list (apart from germanium).

REGISTRY NUMBERS AND B,C,E FRAGMENTATION CODING

In CPI Sections B, C and E, chemical structures and compounds may also be searched using fragmentation coding. A detailed description of the facility is given in I.M.3A and I.M.3D. The fragmentation coding is applied to:

- (i) end products of reactions,
- (ii) novel starting materials and intermediates,
- (iii) compounds analysed, tested or detected;
- (iv) compounds used, other than as starting materials;
- (v) important ingredients in compositions,

regardless of whether they are in the registry list, where they appear in the patent (disclosure, examples or claims) or if they are a Markush structure.

Hence a fragmentation code search will directly retrieve such materials entered as RNs. However, other materials (e.g. starting materials which are not novel) are retrievable only by RNs. Searching using RNs will give more specific but less complete retrieval than using fragmentation coding.

Example

The production of sodium chloride (NaCl) is searched on-line as 1706-P/RN, the use of p-bromotoluene as 0782-U/RN, N-bromo-succinimide as a starting material as 1089 - S/RN and any reference to sodium chloride as 1706/RN.

PAGE NUMBERING

The pages which follow have been taken directly from I.M.3A and I.M.4A and retain the page numbering of those manuals. In the case of the list for Sections B to M, this list has been in operation as far as CPI Sections B, C and E are concerned since week 8127 and several of the pages have been reissued since that time. Such pages carry at the bottom right hand corner, the number and date of issue.

LIST FOR CPI SECTIONS B to M

Introduction

The following is a list, in alphabetical order, of 2100 compounds which frequently occur in patent literature.

Each entry contains a "standard compound name", the molecular formula and the four-digit registry number or RN. In addition, some entries also contain a synonym, a more descriptive name for the compound, or a cross-reference citation.

Where the "standard compound name" is given in brackets, then the compound(s) covered are determined by the preceding (alphabetised) name.

Thus with the entry 4-Amino-1-naphthol (AMINO-NAPHTHOL, the RN 1605 covers only 4-amino-1-naphthol, and not other aminonaphthols.

Where compounds (or their derivatives) have been identified as being present in The Merck Index (Merck and Co. Inc.), USAN (U.S. Pharmacopeial Convention Inc.), or The Pesticide Manual (The British Crop Protection Council), then their preferred name(s) is included in the Derwent list. For example DDT (Merck and Pesticide Manual) and chlorophenothane (USAN) are both included.

Conventions used to produce "standard compound names"

(1) For compounds starting with an element name, the element name is replaced by its chemical symbol. For variable valency metals, the RN covers all metal valencies, e.g. 1547 (CU-CHLORIDE) covers both cuprous

and cupric chlorides, and the molecular formula(e) given is only an example(s), and does not limit the coverage.

(2) Partial salts of polyvalent acids are not indexed as RNs unless specifically provided for. Thus aluminium dihydrogen phosphate ($Al(H_2PO_4)_3$) is not indexed as 1797 which is applied only to $AlPO_4$.

(3) AMM is used as an abbreviation for ammonium.

(4) The RN assigned to a compound is usually its shortest known (but not necessarily preferred) name, however for a small number of compounds having very long names, artificial shortened names have been assigned, e.g. by replacing tetrahydro- by TH- or hexahydro- by HH-.

(5) Any spaces present in a compound name are replaced by hyphens, e.g. ACETIC-ACID for RN 0247.

(6) Numbers and letters present in compound names are eliminated wherever possible. Aliphatic chains are assumed to be normal unless specific otherwise. Also S - indicates secondary or symmetrical and T - indicates tertiary.

(7) Greek letters which cannot be eliminated or replaced by a number, are replaced by the first letter of the transliterated English version e.g. B-CAROTENE (β -carotene) and G-SITOSTEROL (γ -sitosterol).

PLASDOC REGISTRY COMPOUNDS

Retrieval of specific compounds as additives and catalysts for polymers in Plasdoc prior to 1984 was very limited. Such compounds could generally be searched only as their function e.g. plasticiser, stabiliser, Friedel-Crafts catalyst etc.

From the beginning of 1984 (8401) it is possible to retrieve about 750 commonly occurring compounds given in the following alphabetical list. Each compound is assigned a Registry Number (RN), one or more such numbers being assigned to each patent, where applicable. The RN for any compound already present in the List for CPI Sections B to M (see I.M.2E) will be the same as that used at present. Those compounds (about 400) not already included will be assigned RNs commencing from 5,000.

FORMAT AND APPLICATION

Each entry in capital letters is followed by the standard four digit RN. Please note the following:-

- (i) The list contains a few classes of compounds. An entry for such a class is followed by the letters NCE (not classified elsewhere). Immediately below the entry are listed all compounds belonging to the class having their own unique RNs. Any specific compound not listed will be assigned the RN corresponding to the generic class. As an example dibutyl adipate is searched using 5115, but diethyl adipate has no specific RN and can only be searched as 5005 (Adipic acid esters NCE).

A list containing all the classes of compounds is provided at the end of this Introduction.

- (ii) Any note within brackets, may follow immediately below the main entry. If a note 'See also---' is followed by a RN, then this RN should not be used for searching the main entry. This note points to a related term available for, usually, wider searching.

As an example, under the entry zinc acetate is given the note (see also Acetic acid (0247)). This note is only given as cross-reference and 0247 should not be searched for zinc acetate.

- (iii) All the rules described under the heading 'Sections B to M application' on p.1 of the Intro. to I.M.2E also apply to Plasdoc Registry Compounds. In particular please remember:-
 - (a) The RN for an organic acid includes all metal salts thereof unless these are specifically excluded in a note below the acid. All the salts which are excluded have their own specific RNs.

- (b) Variable oxidation state metal salt includes all salts e.g. Iron chloride (1939) includes both ferrous and ferric chlorides. The one exception is titanium chloride where specific RNs are available for the trivalent and tetravalent titanium chloride.
- (iv) A limited number of synonyms have been included in the list.

ROLES IN PLASDOC RNs

Each RN is assigned one of three roles (same as Chemical Code RNs)

- P - Production (by reaction, purification etc.)
- S - Starting material
- U - Use (excluding-S) e.g. in polymer compositions

INDEXING APPROACH

RNs from the list are applied to all registry compounds present in the claims or examples except for those which are unimportant e.g. specific solvents where any solvent may be used.

REGISTRY NUMBER CONTROL CODE 014

To facilitate retrieval of Plasdoc RNs from 1984 only, each Plasdoc record is assigned the three digit control code 014 from 8401. Use of this code will avoid hits resulting from earlier Chemical Code RNs and facilitate searching of the Plasdoc Code with RNs.

SEARCHING

The following points should be borne in mind.

- (i) The Chemical Code RNs are assigned from 1981 (week D27) and those of Plasdoc Code from 8401. Some registry compounds (approx. 300) are common to both Codes.
- (ii) A RN can be searched with or without a role (truncation is not necessary) e.g. for production of acetyl peroxide search 5003-P/RN. For all references search 5003/RN.
- (iii) A registry compound may have more than one function e.g. triphenyl phosphate can function as a plasticiser as well as a flame retardant.

Examples

(A) Searching RNs only

- (a) All references to triphenyl phosphate in Plasdoc
0973/RN AND 014/A
- (b) Production of triphenyl phosphate
0973-P/RN (incl. pre-1984 hits from Sections B,C and/or E)

- (c) Triphenyl phosphate plasticiser
0973-U/RN AND 014/A AND
2234/KS
- (d) Asbestos filler
5024/RN AND 2215/KS
(014 is not needed as
5024/RN only applies from
1984)

Thiuram disulphides NCE
Trihydrocarbyl phosphates NCE
Trimellitic acid esters NCE
Vinyl silanes NCE

(B) RNs and Plasdoc Code

All additives and catalysts for polymers (CPI Section A) are retrievable (usually by function only) using the Plasdoc punch code, fully described in Instruction Manuals 4A and 4B, and the Plasdoc Code Dictionary (I.M.4F).

For references prior to 1984 use of the Plasdoc Code is necessary. The materials classified in Plasdoc and Sections B,C and/or E may also be searched using the Chemical Code fragmentation codes.

An example using the Standard Plasdoc Code Search Strategy Form, which includes a search statement for Plasdoc RNs is given below. The search logic can be searched on both WPI and WPIL files.

Example

Triphenyl phosphate plasticiser for vinyl chloride-vinyl acetate copolymer. It is assumed that online the following commands have been entered:
SYN + FOR LINK; SYN . FOR OR; SYN > FOR
AND; SUBS A, KS
